

Cambridge International AS & A Level

COMPUTER SCIENCE		9618/43
Paper 4 Practical		October/November 2022
MARK SCHEME		
Maximum Mark: 75		
	Published	

This mark scheme is published as an aid to teachers and candidates, to indicate the requirements of the examination. It shows the basis on which Examiners were instructed to award marks. It does not indicate the details of the discussions that took place at an Examiners' meeting before marking began, which would have considered the acceptability of alternative answers.

Mark schemes should be read in conjunction with the question paper and the Principal Examiner Report for Teachers.

Cambridge International will not enter into discussions about these mark schemes.

Cambridge International is publishing the mark schemes for the October/November 2022 series for most Cambridge IGCSE™, Cambridge International A and AS Level components and some Cambridge O Level components.

Generic Marking Principles

These general marking principles must be applied by all examiners when marking candidate answers. They should be applied alongside the specific content of the mark scheme or generic level descriptors for a question. Each question paper and mark scheme will also comply with these marking principles.

GENERIC MARKING PRINCIPLE 1:

Marks must be awarded in line with:

- the specific content of the mark scheme or the generic level descriptors for the question
- the specific skills defined in the mark scheme or in the generic level descriptors for the question
- the standard of response required by a candidate as exemplified by the standardisation scripts.

GENERIC MARKING PRINCIPLE 2:

Marks awarded are always whole marks (not half marks, or other fractions).

GENERIC MARKING PRINCIPLE 3:

Marks must be awarded **positively**:

- marks are awarded for correct/valid answers, as defined in the mark scheme. However, credit
 is given for valid answers which go beyond the scope of the syllabus and mark scheme,
 referring to your Team Leader as appropriate
- marks are awarded when candidates clearly demonstrate what they know and can do
- marks are not deducted for errors
- marks are not deducted for omissions
- answers should only be judged on the quality of spelling, punctuation and grammar when these
 features are specifically assessed by the question as indicated by the mark scheme. The
 meaning, however, should be unambiguous.

GENERIC MARKING PRINCIPLE 4:

Rules must be applied consistently, e.g. in situations where candidates have not followed instructions or in the application of generic level descriptors.

GENERIC MARKING PRINCIPLE 5:

Marks should be awarded using the full range of marks defined in the mark scheme for the question (however; the use of the full mark range may be limited according to the quality of the candidate responses seen).

GENERIC MARKING PRINCIPLE 6:

Marks awarded are based solely on the requirements as defined in the mark scheme. Marks should not be awarded with grade thresholds or grade descriptors in mind.

Question	Answer	Marks
1(a)	1 mark per point: • (global) 1D (Integer) array DataArray • 100 elements	2
	Example program code:	
	<pre>Python DataArray = [0 for I in range (100)]</pre>	
	<pre>Java public static Integer[] DataArray = new Integer[100];</pre>	
	VB.NET Dim DataArray(99) As Integer	
1(b)	 1 mark per point: Procedure ReadFile() header (and end where appropriate) opening file IntegerData.txt (for read) looping through the 100 elements // looping to end of file reading each (and all) value from file and storing in array closing file (in appropriate place) 	6
	 1 mark per point: Exception Handling (for opening the file, or for reading values from the file) with appropriate catch and output messages 	
	Example program code:	
	<pre>Python def ReadFile(): global DataArray</pre>	
	<pre>try: TextFile = "IntegerData.txt" File = open(TextFile, 'r') for X in range(0, 100): DataArray[X] = File.readline() DataArray[X].rstrip('\n') DataArray[X] = int(DataArray[X]) File.close() except IOError: print("Count not find file")</pre>	

© UCLES 2022 Page 3 of 23

Question	Answer	Marks
1(b)	<pre>Java public static void ReadFile() { String Filename = "IntegerData.txt"; try{ FileReader F = new FileReader(Filename); BufferedReader Reader = new BufferedReader(F); for(Integer X = 0; X < 100; X++) { DataArray[X] = Integer.parseInt(Reader.readLine()); } Reader.close(); } catch(FileNotFoundException ex) { System.out.println("No file found"); } catch(IOException ex) { System.out.println("No file found"); } } VB.NET Sub ReadFile() try Dim TextFile As String = "IntegerData.txt" Dim FileReader As New System.IO.StreamReader(TextFile) For X = 0 To 99 DataArray(X) = FileReader.ReadLine() Next FileReader.Close() Catch ex As Exception Console.WriteLine("Invalid file") End Try End Sub</pre>	
1(c)	1 mark per point:	7
	 Function FindValues() (and end where appropriate) and input of data to search for in the array validation/casting(/storing as) of input as integer validation of input between 1 and 100 (inclusive) looping through all 100 array elements comparing input to each array element initialising counter to 0 and then adding 1 each time it is found Returning the total

```
Question
                                    Answer
                                                                       Marks
  1(c)
         Example program code:
         Python
         def FindValues():
           global DataArray
             DataToFind = -1
             while(DataToFind < 1 or DataToFind > 100):
                 DataToFind = int(input("Enter a number between 1
         and 100"))
             Total = 0
             for X in range (0, 99):
                 if DataArray[X] == DataToFind:
                     Total = Total + 1
             return Total
         VB.NET
         Function FindValues()
           Dim DataToFind As Integer
             Console.WriteLine("Enter a number between 1 and 100")
             DataToFind = Console.ReadLine()
           Loop Until (DataToFind >= 1 And DataToFind <= 100)
           Dim Total As Integer = 0
             For X = 0 To 99
               If DataArray(X) = DataToFind Then
                  Total = Total + 1
               End If
             Next
           Return Total
         End Function
         Java
         public static Integer FindValues() {
           Integer DataToFind = -1;
           while(DataToFind < 1 || DataToFind > 100){
             System.out.println("Enter a number between 1 and
         100");
             Scanner in = new Scanner(System.in);
             DataToFind = in.nextInt();
           Integer Total = 0;
           for (Integer X = 0; X < 100; X++) {
             if(DataArray[X] == DataToFind){
               Total = Total + 1;
           return Total;
         }
```

Question	Answer	Marks
1(d)(i)	1 mark per point:	3
	 Calling ReadFile() and then FindValues() (in the main program) storing/using return value from FindValues() outputting return value with appropriate message 	
	Example program code:	
	<pre>Python ReadFile() print("The number appears " + str(FindValues()) + " times")</pre>	
	<pre>Java public static void main(String[] args) { ReadFile(); Integer ReturnValue = FindValues(); System.out.println("The number was found " + ReturnValue + " times"); }</pre>	
	<pre>VB.NET Sub Main() ReadFile() Dim ReturnValue As Integer = FindValues() Console.WriteLine("The number was found " & ReturnValue & " times") End Sub</pre>	
1(d)(ii)	Screenshot showing 61 input and 2 output, e.g.	1
	Enter a number between 1 and 100 61 The number was found 2 times	

© UCLES 2022 Page 6 of 23

Question	Answer	Marks
1(e)	 1 mark per point: procedure declaration (and end where appropriate) and outputting array contents at end of procedure and calling procedure from main program correct outer loop correct inner loop swapping all elements if in incorrect order 	4
	Example program code:	
	<pre>Python def BubbleSort(): global DataArray N = 100</pre>	
	<pre>for I in range(N-1): for J in range(0, N-I-1): if DataArray[J] > DataArray[J+1]: DataArray[J], DataArray[J+1] = DataArray[J+1], DataArray[J] #main</pre>	
	<pre>ReadFile() print("The number appears " + str(FindValues()) + " times") BubbleSort() print(DataArray)</pre>	
	<pre>Java public static void BubbleSort() { Integer Temp = 0; for(Integer I = 0; I < 100-1; I++) { for(Integer J = 0; J < 100-I-1; J++) { if(DataArray[J] > DataArray[J+1]) { Temp = DataArray[J]; DataArray[J] = DataArray[J+1]; DataArray[J+1] = Temp; } } }</pre>	
	<pre>for(Integer X = 0; X < 100; X ++) { System.out.println(DataArray[X]); } }</pre>	
	<pre>public static void main(String[] args) { ReadFile(); Integer ReturnValue = FindValues(); System.out.println("The number was found " + ReturnValue + " times"); BubbleSort(); }</pre>	

© UCLES 2022 Page 7 of 23

Question	Answer	Marks
Question 1(e)	<pre>VB.NET Sub Bubblesort() Dim Outer As Integer = 100 - 1 Dim Swap As Boolean Dim Inner As Integer Dim Temp As Integer Do Inner = 0 Swap = False Do If DataArray(Inner) > DataArray(Inner + 1) Then Temp = DataArray(Inner) DataArray(Inner) = DataArray(Inner + 1) DataArray(Inner) = DataArray(Inner + 1) DataArray(Inner + 1) = Temp Swap = True End If Inner = Inner + 1 Loop Until Inner = Outer Outer = Outer - 1 Loop Until Swap = False Or Outer = 0 For X = 0 To 99 Console.WriteLine(DataArray(X)) Next End Sub Sub Main() ReadFile() Dim ReturnValue As Integer = FindValues()</pre>	Marks
	<pre>Console.WriteLine("The number was found " & ReturnValue & " times") Bubblesort() End Sub</pre>	

Question	Answer	Marks
2(a)(i)	1 mark per point:	5
	 class Card declaration (and end where appropriate) Private attributes declared Number as integer and Colour as string constructor header (and end where appropriate) taking 2 parameters assigning parameters to attributes 	
	Example program code:	
	<pre>Python class Card: #Number as integer #Colour as string definit(self, Number1, Colour1): selfNumber = Number1; selfColour = Colour1;</pre>	

Question	Answer	Marks
2(a)(i)	<pre>Java class Card{ private Integer Number; private String Colour; public Card(Integer Number1, String Colourp) { Number = Number1; Colour = Colourp; }}</pre>	
	VB.NET Class Card Private Number As Integer Private Colour As String Sub New(Number1, Colourp) Number = Number1 Colour = Colourp End Sub End Class	
2(a)(ii)	 1 mark per point: 1 get method as function (and end where appropriate) with no parameters returning the value 2nd correct get method 	3
	Example program code:	
	<pre>Python def GetNumber(self): return selfNumber def GetColour(self):</pre>	
	<pre>return selfColour Java public Integer GetNumber() { return Number; }</pre>	
	<pre>public String GetColour() { return Colour; }</pre>	
	VB.NET Function GetNumber() Return Number End Function	
	Function GetColour() Return Colour End Function	

© UCLES 2022 Page 9 of 23

Question	Answer	Marks
2(a)(iii)	1 mark per point:	2
	 one card initialised as type Card all 15 cards initialised correctly as type Card 	
	Example program code:	
	<pre>Python OneRed = Card(1, "red") TwoRed = Card(2, "red") ThreeRed = Card(3, "red") FourRed = Card(4, "red") FiveRed = Card(5, "red") OneBlue = Card(1, "blue") TwoBlue = Card(2, "blue") ThreeBlue = Card(3, "blue") FourBlue = Card(4, "blue") FiveBlue = Card(5, "blue") OneYellow = Card(1, "yellow") TwoYellow = Card(2, "yellow") ThreeYellow = Card(3, "yellow") FourYellow = Card(4, "yellow")</pre>	
	Java CARD oneRed = new Card(1, "red"); CARD twoRed = new Card(2, "red"); CARD threeRed = new Card(3, "red"); CARD fourRed = new Card(4, "red"); CARD fiveRed = new Card(5, "red"); CARD oneBlue = new Card(1, "blue"); CARD twoBlue = new Card(2, "blue"); CARD threeBlue = new Card(3, "blue"); CARD fourBlue = new Card(4, "blue"); CARD fiveBlue = new Card(5, "blue"); CARD oneYellow = new Card(1, "yellow"); CARD twoYellow = new Card(2, "yellow"); CARD fourYellow = new Card(4, "yellow"); CARD fourYellow = new Card(4, "yellow"); CARD fiveYellow = new Card(5, "yellow");	

Question	Answer	Marks
2(a)(iii)	VB.NET Dim OneRed As New Card (1, "red") Dim TwoRed As New Card(2, "red") Dim ThreeRed As New Card(3, "red") Dim FourRed As New Card(4, "red") Dim FiveRed As New Card(5, "red") Dim OneBlue As New Card(1, "blue") Dim TwoBlue As New Card(2, "blue") Dim ThreeBlue As New Card(3, "blue") Dim FourBlue As New Card(4, "blue") Dim FiveBlue As New Card(5, "blue") Dim FourBlue As New Card(1, "yellow") Dim TwoYellow As New Card(2, "yellow") Dim ThreeYellow As New Card(3, "yellow") Dim FourYellow As New Card(4, "yellow") Dim FourYellow As New Card(4, "yellow") Dim FiveYellow As New Card(4, "yellow") Dim FiveYellow As New Card(5, "yellow")	
2(b)(i)	 class Hand declaration (and end where appropriate) private attribute declarations; FirstCard as integer, NumberCards as integer private attribute array named Cards of type Card with 10 elements constructor with 5 Card objects as parameters assigning each Card parameter to the array (in constructor) initialising FirstCard to 0 and NumberCards to 5 (in constructor) Example program code: 	6
	<pre>Python class Hand: #Cards[10] as Card #FirstCard as integer #NumberCards as integer definit (self, Card1, Card2, Card3, Card4, Card5): selfCards = [] selfCards.append(Card1) selfCards.append(Card2) selfCards.append(Card3) selfCards.append(Card4) selfCards.append(Card5) selfCards.append(Card5) selfFirstCard = 0 selfNumberCards = 5</pre>	

Question	Answer	Marks
2(b)(i)	<pre>Java class Hand{ private Card[] Cards = new Card[10]; private Integer FirstCard; private Integer NumberCards;</pre>	
	<pre>public Hand(CARD Card1, CARD Card2, CARD Card3, CARD Card4, CARD Card5) { Cards[0] = Card1; Cards[1] = Card2; Cards[2] = Card3; Cards[3] = Card4; Cards[4] = Card5; FirstCard = 0; NumberCards = 5; } }</pre>	
	VB.NET class Hand Private Cards(9) As Card Private FirstCard As Integer Private NumberCards As Integer	
	<pre>Sub New(Card1, Card2, Card3, Card4, Card5) Cards(0) = Card1 Cards(1) = Card2 Cards(2) = Card3 Cards(3) = Card4 Cards(4) = Card5 FirstCard = 0 NumberCards = 5 End Sub End Class</pre>	
2(b)(ii)	 1 mark per point: function GetCard() header (and end where appropriate) taking (integer) parameter returning the card at parameter index in array 	2
	<pre>Example program code: Python def GetCard(self, Position): return selfCards[Position]</pre>	
	<pre>Java public Card GetCard(Integer Position) { return Cards[Position]; }</pre>	
	VB.NET Function GetCard(Position) Return Cards(Position) End Function	

© UCLES 2022 Page 12 of 23

Question	Answer	Marks
2(b)(iii)	1 mark per point:	2
	 2 variables (player 1 and player 2) of type Hand using constructor and sending the correct variables as parameters 	
	Example program code:	
	<pre>Python Player1 = Hand(OneRed, TwoRed, ThreeRed, FourRed, OneYellow) Player2 = Hand(TwoYellow, ThreeYellow, FourYellow, FiveYellow, OneBlue)</pre>	
	<pre>Java Hand Player1 = new Hand(OneRed, TwoRed, ThreeRed, FourRed, OneYellow); Hand Player2 = new Hand(TwoYellow, ThreeYellow, FourYellow, FiveYellow, OneBlue);</pre>	
	VB.NET Dim Player1 As New Hand(OneRed, TwoRed, ThreeRed, FourRed, OneYellow) Dim Player2 As New Hand(TwoYellow, ThreeYellow, FourYellow, FiveYellow, OneBlue)	
2(c)(i)	1 mark per point:	6
	 function CalculateValue() header (and end where appropriate) taking one parameter and initialising score to 0 looping through all 5 Card objects in parameter array adding 5 to score for red, 10 to score for blue, 15 to score if yellow adding each card number to score Using GetCard(), GetColour() and GetNumber() correctly Returning calculated score 	
	Example program code:	
	<pre>Python def CalculateValue(Player): Score = 0 for Count in range(0, 4): CardGot = Player.GetCard(Count) Score = Score + CardGot.GetNumber() Colour = CardGot.GetColour() if Colour == "red": Score = Score + 5 elif Colour == "blue": Score = Score + 10 else: Score = Score + 15 return Score</pre>	

© UCLES 2022 Page 13 of 23

Question	Answer	Marks
2(c)(i)	Java	
	<pre>public static Integer CalculateValue(Hand Player) { Integer Score = 0; String Colour; Card CardGot; for(Integer X = 0; X<5; X++) { CardGot = Player.GetCard(X); Score = Score + CardGot.GetNumber(); Colour = CardGot.GetColour(); if(Colour == "red") { Score = Score + 5; }else if(Colour == "blue") { Score = Score + 10; } else { Score = Score + 15; }}return Score;}</pre>	
	VB.NET	
	Function CalculateValue(Player As Hand) Dim Score As Integer = 0 Dim Colour As String Dim CardGot As Card For Count = 0 To 4 CardGot = Player.GetCard(Count) Score = Score + CardGot.GetNumber() Colour = CardGot.GetColour() If Colour = "red" Then Score = Score + 5 ElseIf Colour = "blue" Then Score = Score + 10 Else Score = Score + 15 End If Next Return Score End Function	

Question	Answer	Marks
2(c)(ii)	1 mark per point:	4
	 One function call of CalculateValue () for each player sending the player's hand as parameter Comparing return values and outputting the player with the highest score in an appropriate message or if there was a draw in appropriate message 	
	Example program code:	
	Python	
	<pre>Player1score = CalculateValue(Player1) Player2score = CalculateValue(Player2) if Player1score > Player2score: print("Player 1 wins") elif Player1score < Player2score: print("Player 2 wins") else: print("It's a draw")</pre>	
	Java	
	<pre>Integer Player1score = CalculateValue(Player1); Integer Player2score = CalculateValue(Player2); if(Player1score > Player2score) { System.out.println("Player 1 wins"); }else if(Player2score > Player1score) { System.out.println("Player2 wins"); } else { System.out.println("It's a draw"); }</pre>	
	VB.NET	
	<pre>Dim Player1score As Integer Dim Player2score As Integer Player1score = CalculateValue(Player1) Player2score = CalculateValue(Player2) If Player1score > Player2score Then Console.WriteLine("Player 1 wins") ElseIf Player1score < Player2score Then Console.WriteLine("Player 2 wins") Else Console.WriteLine("It's a draw") End If</pre>	
2(c)(iii)	Output showing player 2 wins, for example:	1
	Player2 wins	

Question	Answer	Marks
3(a)	1 mark per point:	3
	 Declaring (global) 2D array ArrayNodes looping through all 20 × 3 elements of array storing -1 in each element 	
	Example program code:	
	Java	
	<pre>public static Integer[][] ArrayNodes = new Integer[20][3]; for(Integer X = 0; X<20; X++) { for(Integer Y = 0; Y<3; Y++) { ArrayNodes[X][Y] = -1 }}</pre>	
	Python	
	<pre>ArrayNodes = [] for x in range(0, 20): ArrayNodes.append([-1, -1, -1])</pre>	
	VB.NET	
	<pre>Dim ArrayNodes(19, 2) As Integer Sub main() For X = 0 To 19 For Y = 0 To 2 ArrayNodes(X, Y) = -1 Next</pre>	
	Next End Sub	

Question	Answer	Marks
3(b)	1 mark per point:	2
	 initialising each of the first 6 array elements correctly declaring and initialising FreeNode to 6 and RootPointer to 0 	
	Example program code:	
	Python	
	ArrayNodes = [[1,20,5],[2,15,-1],[-1,3,3],[-1,9,4],[-1,10,-1],[-1,58,-1]] FreeNodes = 6 RootPointer = 0	
	Java	
	ArrayNodes[0][0] = 1; ArrayNodes[0][1] = 20; ArrayNodes[0][2] = 5;	
	ArrayNodes[1][0] = 2; ArrayNodes[1][1] = 15; ArrayNodes[1][2] = -1;	
	ArrayNodes[2][0] = -1; ArrayNodes[2][1] = 3; ArrayNodes[2][2] = 3;	
	ArrayNodes[3][0] = -1; ArrayNodes[3][1] = 9; ArrayNodes[3][2] = 4;	
	ArrayNodes[4][0] = -1; ArrayNodes[4][1] = 10; ArrayNodes[4][2] = -1; ArrayNodes[5][0] = -1; ArrayNodes[5][1] = 58; ArrayNodes[5][2] = -1;	
	<pre>Integer FreeNode = 6; Integer RootPointer = 0;</pre>	

Question	Answer	Marks
3(b)	VB.NET ArrayNodes(0, 0) = 1 ArrayNodes(0, 1) = 20 ArrayNodes(1, 0) = 2 ArrayNodes(1, 1) = 15 ArrayNodes(1, 2) = -1 ArrayNodes(2, 0) = -1 ArrayNodes(2, 1) = 3 ArrayNodes(2, 2) = 3 ArrayNodes(3, 0) = -1 ArrayNodes(3, 1) = 9 ArrayNodes(3, 2) = 4 ArrayNodes(4, 0) = -1 ArrayNodes(4, 0) = -1 ArrayNodes(4, 1) = 10 ArrayNodes(5, 0) = -1 ArrayNodes(5, 1) = 58 ArrayNodes(5, 2) = -1 Dim FreeNode As Integer = 6	Widiks
	Dim RootPointer As Integer = 0	

```
Question
                                     Answer
                                                                         Marks
  3(c)
         1 mark for each completed statement (4)
                                                                              5
         1 mark for remainder of function correct
         Pseudocode:
         FUNCTION SearchValue (BYVAL Root : INTEGER, ValueToFind :
         INTEGER)
           IF Root = -1 THEN
             RETURN -1
           ELSE
             IF ArrayNodes[Root,1] = ValueToFind THEN
                 RETURN Root
             ELSE
                 IF ArrayNodes[Root, 1] = -1 THEN
                   RETURN -1
                 ENDIF
             ENDIF
           IF ArrayNodes[Root,1] > ValueToFind THEN
             RETURN SearchValue (ArrayNodes [Root, 0], ValueToFind)
           ENDIF
           IF ArrayNodes[Root, 1] < ValueToFind THEN</pre>
             RETURN SearchValue(ArrayNodes[Root,2], ValueToFind)
           ENDIF
         ENDFUNCTION
         Example program code:
         Python
         def SearchValue(Root, ValueToFind):
           global ArrayNodes
           if Root == -1:
            return -1
           elif ArrayNodes[Root][1] == ValueToFind:
             return Root
           elif ArrayNodes[Root][1] == -1:
             return -1
           if(ArrayNodes[Root][1] > ValueToFind):
             return SearchValue(ArrayNodes[Root][0], ValueToFind)
           if(ArrayNodes[Root][1] < ValueToFind):</pre>
             return SearchValue(ArrayNodes[Root][2], ValueToFind)
```

Question	Answer	Marks
3(c)	<pre>Java public static Integer SearchValue(Integer Root, Integer ValueToFind) { if (Root == -1) { return -1; }else if (ArrayNodes[Root][1] == ValueToFind) {; return Root; }else if (ArrayNodes[Root][1] == -1) { return -1; } if (ArrayNodes[Root][1] > ValueToFind) { return (SearchValue(ArrayNodes[Root][0], ValueToFind)); } if (ArrayNodes[Root][1] < ValueToFind) { return (SearchValue(ArrayNodes[Root][2], ValueToFind)); } return -1; }</pre>	
	<pre>VB.NET Function SearchValue(ByVal Root, ByVal ValueToFind) If ArrayNodes(Root, 1) = ValueToFind Then Return Root ElseIf ArrayNodes(Root, 1) = -1 Then Return -1 End If If ArrayNodes(Root, 1) > ValueToFind Then Return SearchValue(ArrayNodes(Root, 0), ValueToFind) End If If ArrayNodes(Root, 1) < ValueToFind Then Return SearchValue(ArrayNodes(Root, 2), ValueToFind) End If Return -1 End Function</pre>	

Question	Answer	Marks
3(d)	1 mark per point (Max 7):	7
	 (procedure) header (and end where appropriate) with one parameter (root node or index of root node) and at least one recursive call checking if left node is -1 if not recursive call with parameter as ArrayNodes [RootNode [0]] checking if right node is -1 if not recursive call with parameter as ArrayNodes [RootNode [2]] 	
	 outputting the element at the parameter RootNode [] all 3 in the correct order 	
	Example program code:	
	<pre>Python def PostOrder(RootNode): if RootNode[0] != -1: PostOrder(ArrayNodes[RootNode[0]]) if RootNode[2] != -1: PostOrder(ArrayNodes[RootNode[2]]) print(str(RootNode[1]))</pre>	
	<pre>Java public static void PostOrder(Integer[] RootNode) { if(RootNode[0] != -1) { PostOrder(ArrayNodes[RootNode[0]]); } if(RootNode[2] != -1) { PostOrder(ArrayNodes[RootNode[2]]); } System.out.println(RootNode[1]); }</pre>	
	<pre>VB.NET Sub PostOrder(RootNode() As Integer) Dim TempArray(2) As Integer If RootNode(0) <> -1 Then TempArray(0) = ArrayNodes(RootNode(0), 0) TempArray(1) = ArrayNodes(RootNode(0), 1) TempArray(2) = ArrayNodes(RootNode(0), 2) PostOrder(TempArray) End If If RootNode(2) <> -1 Then TempArray(0) = ArrayNodes(RootNode(2), 0) TempArray(1) = ArrayNodes(RootNode(2), 1) TempArray(2) = ArrayNodes(RootNode(2), 2) PostOrder(TempArray) End If Console.WriteLine(RootNode(1))</pre> End Sub	

Question	Answer	Marks
3(e)(i)	1 mark per point:	3
	 calling SearchValue() with 15 and rootPointer as a parameter if return value > -1 output returned index and if return value = -1 output not found Both as appropriate messages Calling PostOrder() with ArrayNodes[RootPointer] as a parameter 	
	Example program code:	
	<pre>Python ReturnValue = SearchValue(RootPointer, 15) if ReturnValue == -1: print("Not found") else: print("Found at " + str(ReturnValue)) PostOrder(ArrayNodes[RootPointer])</pre>	
	<pre>Java Integer ReturnValue = SearchValue(RootPointer, 15); if(ReturnValue == -1) { System.out.println("Not found"); } else { System.out.println("Found at " + ReturnValue); } PostOrder(ArrayNodes[RootPointer]);</pre>	
	<pre>VB.NET Dim returnvalue As Integer = SearchValue(RootPointer, 15) If returnvalue = -1 Then Console.WriteLine("Not found") Else Console.WriteLine("Found at " & returnvalue) End If Console.WriteLine("Post order") Dim TempArray(2) As Integer TempArray(0) = ArrayNodes(RootPointer, 0) TempArray(1) = ArrayNodes(RootPointer, 1) TempArray(2) = ArrayNodes(RootPointer, 2) PostOrder(TempArray)</pre>	

Question	Answer	Marks
3(e)(ii)	Screenshot with result as shown, for example:	1
